

Email 1:

Is this email Safe or Malicious?	My Analysis
Safe	The email looks safe as the user name and the email have the same. As the other party replied back it seems as they both are someone who know each other. Also there is no mentioning of a directing link.

Email 2:

Is this email Safe or Malicious?	My Analysis
Malicious	The sender is from russia. The services provided by Microsoft won't send a mail regarding the updation of email id as saying "Office 365 id". They probably know. The sender tries to send a malicious link which looks like a legitimate platform link, but it also said about the sign up, but if the person needs to view the large files from one drive he must be signed up before hand in his PC, as notifications from one drive are in regular. In this link the hacker tries to gain the security credentials of the person and the hacker has tried to intensify the word "SECURITY" which is not a thing to be done. The last is the sender name and the "Office 365" Thank you is not matching. Also, the it is "Customer Support" and not "Customers support"

Email 3:

Is this email Safe or Malicious?	My Analysis
Malicious	Here the email has been sent perfectly impersonating someone(Vinny) as the email and the sender is the same. Also

	the link doesn't look suspicious but the tiny little miscalculation done by the impersonator is the facebook link "B" is kinda different than that of the original site. I think it's a proxy site or a same original looking site in which when credentials entered may get stolen by the impersonator. Also the login.htm is not sureproof because the login page would be a .html extension.

Email 4:

Is this email Safe or Malicious?	My Analysis
Malicious	The page seems to be sent between two parties who know each other by forwarding it but the forwarded email by the info@massdrop and its name suggesting Drop (Formerly Massdrop) is not relatable to tell. I think here the phisher is trying to make the front person to see him as trustworthy.

Email 5:

Is this email Safe or Malicious?	My Analysis
safe	The email sent seems to be a very legitimate email. There is no mistake to be seen in this email. It's just my personal thinking that tells me it's malicious is because FBI agents use a very secure way of contacting even if there are no methods left.

Email 6:

Is this email Safe or Malicious?	My Analysis
Safe	The email from the start to the end is based on the work and some break. The sender and the receiver's email id and the names match. Both of them also referenced their workplace i.e ANZ which is also in capital

Email 7:

Is this email Safe or Malicious?	My Analysis
Malicious	The sender email id name and the regards name is different. It is fake php link which is trying to redirect the person to click on it by giving a cheeky headline about getting some % off in car insurance.
